

Abstract

Method for switching voice traffic relations between a telephone communication network and an Internet

A call diversion (CF) is set in the telephone communication network (FEN) by a telephone terminal (FE) before an Internet session or by an associated Internet terminal (IKE) during an Internet session, in such a manner that a connection-setup for a voice traffic relation, set up from a further telephone terminal (FE) to the telephone terminal (FE), is diverted to the associated Internet terminal (IKE). As a result, Internet terminals (IKE) associated with telephone terminals (FE) and currently conducting an Internet session can be reached.
